Part A — Real-business audit: audit notes (1 page)

FIELDWORK PENDING. The real-business visit has not happened yet. Every field below is an empty slot to be filled from the actual conversation. Nothing on this page is an observation, and no quote, photo or number has been invented. Per the brief, the business name, area and owner phone go in the submission email, not in this PDF.

Business type / what they make	[FILL IN after visit: e.g. type of unit, 2–3 main products. Must make, process or repair something (not resale).]
Approx. orders per day / month	[FILL IN: owner's number, and how they arrive at it]
How an order arrives	[FILL IN: walk-in / phone / WhatsApp / other, and rough share of each]
Interview details	Date: [ ] Mode: [in person / video] Length: [ ] min (minimum 20) Spoke to: [owner / manager]
Tracking tools today	[FILL IN: paper / register / Excel / WhatsApp / Tally / app; who writes in it and when]
#1 recurring problem and its cost	[FILL IN: what goes wrong most often; cost in time or money, in the owner's own numbers]
Owner quote 1 (original language)	"[FILL IN verbatim, in the language spoken]"
Owner quote 2 (original language)	"[FILL IN verbatim, in the language spoken]"
Permissions	[ ] Owner agreed to share business name, area and phone with Wantace only [ ] Photos allowed [ ] Personal details (phones, amounts) blurred

Order-to-delivery steps (fill from the conversation, in the owner's order)

#	What happens (customer asks → delivered and paid)	Who does it	Record / tool used	Typical time
1	[ ]	[ ]	[ ]	[ ]
2	[ ]	[ ]	[ ]	[ ]
3	[ ]	[ ]	[ ]	[ ]
4	[ ]	[ ]	[ ]	[ ]
5	[ ]	[ ]	[ ]	[ ]
6	[ ]	[ ]	[ ]	[ ]
7	[ ]	[ ]	[ ]	[ ]
8	[ ]	[ ]	[ ]	[ ]

Blank rows are for the real steps; add or delete rows as needed so the page stays within one page after filling.

Part A — Evidence pages (process map and tracking photos)

PHOTOS PENDING. Insert real photographs here after the visit. Ask permission first. Blur phone numbers and amounts. Do not use stock or sample images.

1. Hand-drawn order-to-delivery process map (photo). Neatness does not matter; accuracy does.
[Insert photo here]

2a. How they track work today (photo 1)	**2b. How they track work today (photo 2)**
[Insert photo here] Caption: [what it is, who writes in it, what is blurred]	[Insert photo here] Caption: [what it is, who writes in it, what is blurred]

A third photo is optional. The owner's name, area and phone number are sent only in the submission email, with their permission.

Part B — Requirement document: Vardhan Steelware (Phase 1)

For engineers who were not on the call. **Sources:** first-call notes (12 Oct 2026), WhatsApp export "Vardhan Dispatch" (3–7 Sep 2026), Kunal's order sheet (1–7 Sep 2026, 25 rows). Tags: **[E]** = directly in the material, **[I]** = my inference, to be confirmed.

1. The problem in the client's words

Suresh (owner): **"Problem orders ki nahi hai. Problem yeh hai ki pata nahi chalta maal kahan atka hai."** *(The problem isn't orders; we can't tell where the goods are stuck.)* Today the answer is a phone chain: **"Customer phone karta hai toh mujhe Ramesh ko phone karna padta hai. Ramesh ki diary mein sab hai."** What he wants: **"Mujhe bas phone pe dekhna hai kaunsa order kahan hai."** Constraints: a ₹1.2 lakh ERP bought in 2023 ran three months and Ramesh and the karigars never used it; he wants this before Diwali. Kunal asks for something different: Amazon/Flipkart integration, an AI sales-prediction dashboard and a "modern" look (see §4).

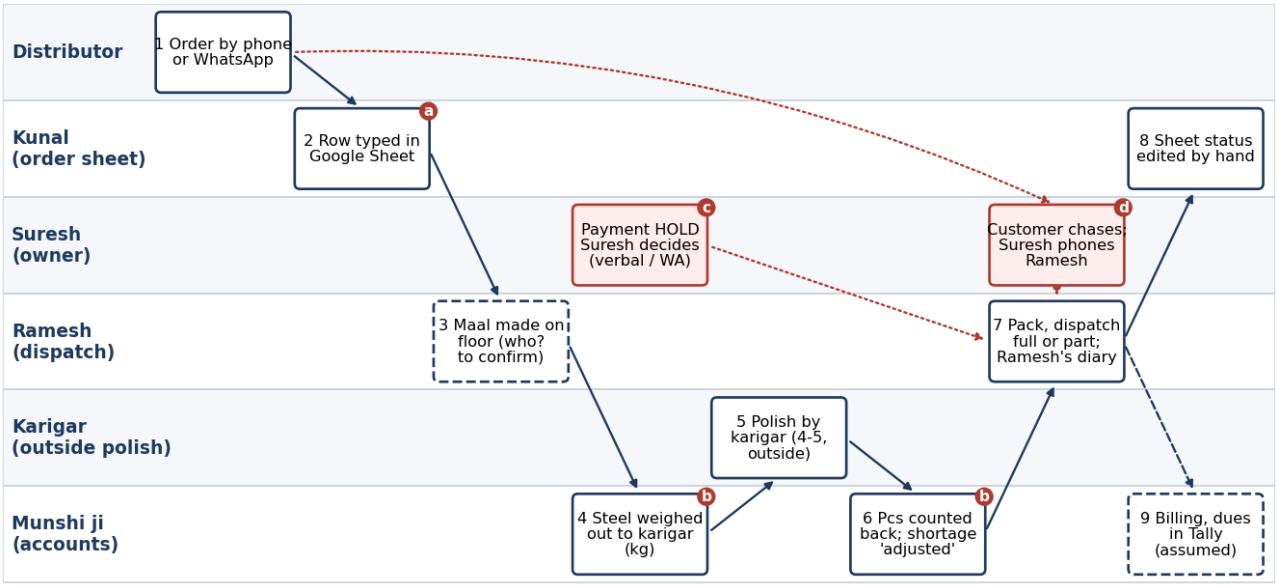

Problem statement: order status, and the reason an order is delayed, live in Ramesh's diary and in people's heads, not on a screen the owner can open on his phone.

2. What the material shows

Topic	Finding (evidence)	Versus what the client said
Volume	25 order lines in 7 days (3.6/day). Pace ≈ 94–107 lines/month (94 if the 3 candidate duplicates below are removed). **[E]** counts; **[I]** extrapolation.	Suresh: "60–70". Kunal: "usse zyada". **Sheet leans to Kunal**, but it is one pre-Diwali week and a line is not always an order.
Status	12 dispatched, 12 open: pending ×7, "pend" ×2, hold ×2, partly disp ×1; plus 1 return. Status is typed free-text; the reason for being stuck sits in "remarks"; 2 open lines (Jain 2 Sep, Sharma 7 Sep) have no remark. **[E]**	Matches Suresh's "pata nahi chalta".
Why lines are open	Of 12 open: 5 wait on polish (Bansal ×2, New Delhi Bhagona 60, Gupta Bhagona 40, Mehra balance 120); 2 payment hold; 1 rate missing (Verma); 3 unexplained / repeat-suspect (Gupta 2nd, Jain ×2); 1 new order (Bansal 60). Mehra's reason comes from WhatsApp, not the sheet. **[E]**	Polish is the most common stated blocker, yet Suresh calls polish loss "chalta hai".
Duplicate candidates (not confirmed)	(a) Gupta Kadai No.10, 200 pcs @185, both 01-09: one dispatched, one pending, remark "repeat msg?". (b) Jain Kadhai No 10, 150 pcs @192, 2 Sep and 4 Sep, both pending, remark "again sent on whatsapp". (c) Bansal Tope No.6, 120 pcs @340, 3 Sep and 5 Sep, both "polish se aana baaki"; a third Bansal line on 7 Sep is labelled "naya order", which hints the first two may be one order entered twice. Up to 470 pcs (200+150+120) of open demand may be overstated. **[E]** rows; **[I]** duplicate status.	**Not duplicates:** New Delhi Thali 50 dozen on 2 Sep and 7 Sep (both dispatched, 5 days apart: likely repeat buying); Ramesh asked on 7 Sep if Bhagona is "written in two places", but Gupta 40 and New Delhi 60 are two different parties. Customers re-sending messages (Jain) is likely a symptom of no visibility **[I]**.
Partial dispatch	Mehra Kadai No.10: 300 ordered; 180 sent 4 Sep (Ramesh confirms on WhatsApp), 120 sent 6 Sep as a separate row "baaki wala". 180+120 = 300 reconciles, but the original row still says "partly disp" and a naive sum gives 420. **[E]**	Needs dispatch events against one line, not a new row.
Payment holds	Sharma Karnal: Gilas 30 dozen (3 Sep) and Patila 20 sets (7 Sep) on hold; remark "old dues 1.8L" (≈ ₹1.8 lakh if L = lakh). Indicative held value ₹26,200 (30×260 + 20×920, assuming rate per listed unit). 3 Sep: "Papa ne bola pehle purana payment". 5 Sep: Sharma asks "gilas kab tak? Diwali ka maal hai"; Kunal → Ramesh "check karo"; Ramesh "Hold pe hai na?"; Kunal "Papa se pucho". No reply to the distributor is visible and nobody owns the release. A distributor's message appears in the internal dispatch group (member? to confirm). **[E]**	Suresh: "Payment koi problem nahi." **Contradicted** for at least one party.
Return	Sharma Gilas **−6 dozen**, 5 Sep, "dent", entered as a negative quantity in the order sheet, not linked to any dispatch (no Sharma gilas dispatch in 1–7 Sep, so the original shipment is outside the sample **[I]**). Indicative value −₹1,560. A sum would silently net the order. **[E]**	Return from a party that is on payment hold.
Missing party	3 Sep Thali 12 inch, 20 dozen @600, "dispatched", party blank (≈ ₹12,000). Rate 600 differs from New Delhi 610 / Verma 605, so it cannot be matched by rate. Shipped but cannot be traced or billed. **[E]**	
Missing rate / unit	Verma "Kadhai 10 no.", 180 **kg**, rate blank, "rate confirm karna hai". Every other Kadhai/Kadai No.10 line is in pcs: kg vs pcs is unexplained **[I]**. **[E]** rows.	
Messy data	3 date formats (01-09-26, 2/9/2026, 3 Sep); Kadai / Kadhai / "Kadhai 10 no."; Gilas 300ml / 300 ml; Bhagona 8L / 8 ltr; one distributor appears under 3 names across sheet and WhatsApp. Same item has different rates by party (Kadai No.10: 180 / 185 / 192; 240 online): treat as party pricing, not error **[I]**. Rate unit is never stated.	Text matching cannot find duplicates reliably; masters with aliases are needed.
Polishing	3 Sep, Munshi ji: gave Pappu 420 kg, 1180 pcs came back, "hisaab kal". 6 Sep: "Pappu ka 6 kg short. Next lot mein adjust." 6 kg = 1.4% of that lot (≈ 0.36 kg/pc if one item; the item is not stated). Goods go out weighed ("tol ke") and come back counted ("gin ke"), so how "6 kg" was derived is unknown. The lot is not linked to any order. **[E]**	Kunal: last year's audit "3–4% difference"; Suresh: "woh wastage hai". Same number, two readings. 3–4% of 420 kg = 12.6–16.8 kg, but the audit basis is unknown, so **not comparable**. Shortage is **reported, not verified**; no evidence of theft.

Topic	Finding (evidence)	Versus what the client said
Online	3 of 25 lines (12%), ≈ ₹46,192 of ≈ ₹5.86 lakh indicative value (≈ 8%), all dispatched, entered as "Online - Kunal" (amazon / flipkart). One week cannot show growth **[I]**.	Kunal: "30% every month". Suresh: "5% bhi nahi". **Neither verified.**

3. As-is process map

Red = observed pain points: (a) status is free text in remarks; (b) polish lots not tied to orders, shortage carried forward informally; (c) hold decision not visible to dispatch or customer; (d) 'where is it' = phone call + Ramesh's diary.
Dashed box = assumed, to confirm with client. Dotted red = informal loops. Sources: first-call notes, WhatsApp export, order sheet.

Assumed, to confirm: who makes the goods before polish; who invoices and when; how goods are transported. A separate PNG of this map is supplied.

4. Phase 1 scope

Goal: Suresh opens one phone screen and sees, for every open order line, its stage, days in that stage and the reason it is stuck, kept current by Ramesh in three taps or fewer. **Adoption rules:** Hindi-first with English toggle; works in a mobile browser on a mid-range Android; no karigar login; 2-week parallel run beside Ramesh's diary; one-time import of the current sheet.

IN Phase 1	OUT of Phase 1 (and why)
Order lines with a fixed stage list and history Partial dispatch (balance auto-computed) Payment hold with reason, owner and date Returns as their own records Polish lots: issue, receive, shortage, adjustments Exception queue (duplicates, missing party or rate, stuck too long) Three morning reports; roles and permissions	**Amazon/Flipkart integration:** 3 of 25 lines, entered by hand without trouble; revisit with months of data. **AI sales forecast:** one week of messy data; 30% growth unverified. **Full ERP, stock, production planning, GST invoicing:** the 2023 ERP failed on complexity; Munshi ji stays on Tally (no integration yet). **Distributor portal, WhatsApp notifications, karigar app:** earlier trust and clean data first. **Rate master and payments ledger:** rates vary by party; only a hold flag now.

Functional requirements (each testable; "stage" = Received, In making, At polish, Ready, Partly dispatched, Dispatched, Cancelled):

ID	Requirement	Acceptance criteria
FR-1	Party and item masters with aliases; order lines pick from lists, not free text.	"Kadhai No 10" and "Kadai No.10" resolve to one item. A line cannot be saved without party, item, qty > 0 and a unit allowed for that item.
FR-2	Create an order with one or more lines (item, qty, unit, optional rate), channel and received date.	Online sales use a party such as "Online – Amazon". Blank rate saves and raises a "rate missing" flag.
FR-3	Every stage change is logged (who, when, from, to); the list shows days in current stage.	Changing a stage creates an event; the line shows "3 days at polish". Ramesh can change a stage from the list in ≤ 3 taps and no typing (tested on his phone).
FR-4	Dispatch is an event on a line (qty, date); balance = ordered − dispatched.	300 ordered, then dispatch 180 and 120: one line, two events, balance 0, stage Dispatched, total still 300. Dispatching more than the balance is blocked.
FR-5	Dispatch with blank rate or party needs an override reason from Kunal or Suresh.	Override is logged and shows in the exception queue.
FR-6	Payment hold: Suresh places or releases a hold with a reason; dispatch is blocked while held.	Ramesh sees "On hold – payment" and the date; the dispatch button is disabled; only Suresh can release; history is kept.
FR-7	Returns are records, never negative quantities: party, item, qty (positive), reason, date, optional original line, resolution (replace / credit / reject / pending).	Entering "6 dozen gilas, dent" creates a Return and leaves order totals unchanged; open returns appear in Report 2.

ID	Requirement	Acceptance criteria
FR-8	Polish issue: karigar, date, kg issued, optional linked lines.	Lot with kg > 0 saves and shows days out.
FR-9	Polish receive: pcs, date, kg returned (if weighed); shortage kg and % are computed; tolerance is set by Suresh.	420 kg issued and 414 kg back gives 6 kg (1.4%); status "Short – adjustment pending" until closed.
FR-10	Adjustment ledger: "adjust next lot" is a record (kg, karigar, source lot, target lot, agreed by).	A karigar page lists outstanding adjustment kg; a shortage cannot be closed without a record or an "accepted" note.
FR-11	Duplicate candidate check on save: same party, item and qty on an open line within 7 days (setting).	Gupta 200 pcs @185 on the same day raises a flag. Nothing is auto-deleted; the user picks "not duplicate" or cancels one line with a reason.
FR-12	Exception queue: missing party or rate, unit mismatch, duplicate candidate, stuck > N days (default 3), polish out > N days, hold older than N days.	Count shows on home; each flag has a resolve note and stays in history.
FR-13	One-time import of the current sheet with an exception report.	The 25 sample rows import with none dropped; blank party, blank rate, −6 qty and repeats land in the queue, not silently cleaned.
FR-14	Roles as in §6; all labels in Hindi and English.	Munshi ji cannot dispatch; Ramesh cannot release a hold; distributors and karigars have no access. Reports open in < 3 s on 4G with 200 open lines.

5. Data model

Entity	Key fields	Relationships
Party	id, name, city, type (distributor / online), aliases	1 → n Orders; 1 → n Returns
Item	id, canonical name, aliases, allowed units, piece weight kg (optional)	1 → n OrderLines
Order	id, party_id, received_on, channel, entered_by	1 → n OrderLines
OrderLine	id, order_id, item_id, qty_ordered, unit, rate (nullable), stage	1 → n Dispatches, Holds, StatusEvents, Flags; 0 → n LotLines
Dispatch	id, line_id, qty, dispatched_on, dispatched_by, transport ref (optional)	n → 1 OrderLine
Hold	id, line_id, reason, placed_by / on, released_by / on	n → 1 OrderLine
Return	id, party_id, line_id (nullable), item_id, qty (positive), unit, reason, resolution	n → 1 Party; 0..1 OrderLine
Karigar	id, name	1 → n PolishLots
PolishLot	id, karigar_id, issued_on, issued_kg, returned_on, returned_pcs, returned_kg (nullable), shortage_kg (computed)	1 → n LotLines, Adjustments
LotLine	lot_id, line_id (nullable), item_id, pcs	links a lot to the orders it serves (fixes the missing lot ↔ order link)
Adjustment	id, lot_id, kg, carried_to_lot_id, agreed_by, note	n → 1 PolishLot
StatusEvent	id, line_id, from, to, by, at	n → 1 OrderLine; n → 1 User
ExceptionFlag	id, type, entity ref, raised_on, resolved_by, note	n → 1 OrderLine (or Lot)
User	id, name, role, language	1 → n StatusEvents

Design choices: quantity is always positive and carries a unit; dispatches, holds, returns and adjustments are their own records (never a status typed on a row or a negative number); item and party aliases fix the naming mess. ER sketch supplied as a separate PNG.

6. Users (on a phone)

Role	Person	Sees	Does
Owner	Suresh	Home: three morning reports and exception count; any line with its history; tap to call party or Ramesh	Places or releases holds; sets tolerances and "stuck" days
Order desk	Kunal	All lines; exception queue	Creates orders and lines; resolves duplicates and missing data; cannot release holds
Dispatch	Ramesh	Open lines by stage, Ready list, holds with reason, polish lots due back	Changes stage in ≤ 3 taps; records dispatch qty; records returns received and pcs back from polish
Accounts	Munshi ji	Polish lots, shortages, adjustments; holds and returns (read)	Records kg issued and returned and adjustments; cannot dispatch
No access	Karigars, distributors	—	Phase 1: Ramesh or Munshi ji record on their behalf

7. Three reports Suresh would open every morning

Report	Contents	Decision it supports
1. Kahan atka hai	All open lines grouped by blocker (At polish, On hold, Ready not dispatched, Rate/party missing, Partial balance), oldest first, with party, item, balance and days in stage; count of entries needing a check.	Whom to chase today (Ramesh, a karigar, Kunal) without phoning around.

Report	Contents	Decision it supports
2. Holds and returns to decide	Each held line: party, indicative value if rate known, days on hold, party's other open lines; open returns with reason and age.	Release or keep a hold; replace, credit or reject a return.
3. Polish desk	Per karigar: lots out (kg, days out), lots back with shortage kg and %, outstanding adjustments, lots beyond N days.	Chase a late karigar; accept or dispute a shortage.

8. Questions for the next call

#	Question	Ask
1	What exactly does "Diwali se pehle" mean: a date, and live use or a demo? What would you accept as success by then?	Suresh
2	Walk us through your diary: what do you write per order, when, and in what words? Which phone do you use, and is there network on the floor?	Ramesh (on the floor, not on the call)
3	How was "6 kg short" worked out (standard piece weight, re-weigh)? Where is the polish hisaab kept (Tally, paper)? How does "next lot mein adjust" get recorded?	Munshi ji
4	What polish loss is acceptable per item, and who decides? Is last year's 3–4% what you call normal?	Suresh, Munshi ji
5	Who can place or release a hold, per order or per party? Does the distributor get told?	Suresh
6	Does the sheet date mean order date or entry date? Are Gupta 200 (1 Sep), Jain 150 (2 and 4 Sep) and Bansal 120 (3 and 5 Sep) real repeats or the same order?	Kunal
7	Who is the blank-party Thali 20 dozen (3 Sep)? Is Verma's Kadhai 180 kg meant as kg or pcs, and what is the rate?	Kunal, Ramesh
8	Who is in the "Vardhan Dispatch" WhatsApp group (is Sharma Bartan in it)? Who else can see the dues discussion?	Kunal
9	How are dented returns handled (replace, credit note, scrap), who inspects them, and how do you link them to the original shipment?	Ramesh, Munshi ji
10	Monthly online orders for the last 6 months, and what must "Amazon/Flipkart integration" actually do? What failed in the 2023 ERP, and who will insist on using the new one?	Kunal; Suresh

9. Biggest risk and how to reduce it

Risk: the floor does not use it, so the data goes stale and Suresh stops trusting it, as happened with the 2023 ERP. Ramesh (22 years, diary) holds the real status, and we have not yet heard from him; Kunal's feature wishes could also pull scope away from this. **Mitigation:** (1) spend half a day with Ramesh before building and copy his diary fields; (2) Hindi, three taps, no typing, no karigar login; (3) Suresh commits to checking the app instead of phoning Ramesh, so the update has a reason; (4) 2-week parallel run beside the diary, with a proposed pilot target of same-day updates for most dispatches (to agree with Ramesh); (5) ship the smallest useful slice first (stages, dispatch, holds), polish module second; (6) give Kunal a clean, modern-looking screen he can be proud of, with his bigger asks scheduled for later.

Part C — Handoff note for the Account Executive

Who decides / influences / uses. Decides: **Suresh** (58, owner, signs cheques); confirm his spending limit and whether Kunal can sign. Influences: **Kunal** (30, MBA, owns the order sheet; wants a "modern" system to show distributors) and **Munshi ji** (Tally, polish hisaab). **Ramesh** (22 yrs) has an informal veto by not using it. Users: Ramesh (updates), Munshi ji (polish, holds), Kunal (entry), Suresh (view). We have not yet spoken to Ramesh.

Real pain. Suresh cannot see where an order is stuck; he phones Ramesh, who reads his diary. In 1–7 Sep, 12 of 25 sheet lines are open with reasons in free text (5 polish, 2 payment hold, 3 repeat or unexplained); distributors re-send orders and chase on WhatsApp; a 6 kg polish shortage on a 420 kg lot is settled informally. A ₹1.2 lakh ERP was dropped after 3 months.

Client asks for	Client needs
Kunal: Amazon/Flipkart integration, AI sales prediction, "modern look". Suresh: "phone pe dekhna hai kaunsa order kahan hai", before Diwali, pay only for what works ("jo kaam kare, uska de denge").	Online is "30% growth a month" (Kunal) vs "under 5%" (Suresh); sheet: 3 of 25 lines. Stage, age and reason per order; partial dispatch; returns; polish reconciliation; exceptions.

Expect this objection	Suggested response
"The last ERP wasted money."	Show a small Phase 1 on his own phone, built with Ramesh. Structure the commercials so he sees it working early (your call).
"Ramesh and the karigars won't use it."	We start by sitting with Ramesh; Hindi, three taps; karigars are not users; two weeks beside his diary.
Kunal: "It needs Amazon and AI."	Later, once there are months of clean data; online is a small slice. Phase 1 can still look modern.
"Payments and polish are fine."	Do not argue. Show holds and the 6 kg lot as visibility, not blame; never imply theft.

Next step and timelines. Book a 45-minute follow-up this week with Suresh, Kunal and **Ramesh in the room** (bring the diary), plus 10 minutes with Munshi ji; use the 10 questions in Part B §8. On timing, do not promise "full system by Diwali". Ask what the deadline means, then offer a small usable slice (stages, dispatch, holds) first, with polish reconciliation to follow, and confirm dates only after the Ramesh walk-through. No price is in this note.

Part D — Content (provisional)

PROVISIONAL — validate after the real Part A audit. No verified audit observations exist yet, so both assets are built on one hypothesis: that for many small factories, order status is scattered across calls, notebooks and WhatsApp. Replace the hypothesis lines with one real, anonymised observation from the visit before submitting. No names, statistics or promises are used.

1. LinkedIn post (for factory owners)

Ask a factory owner: "Where is this order right now?"
Then watch. A call to the floor. A notebook gets opened. Someone scrolls a WhatsApp group. Ten minutes later: "Should be ready tomorrow."
The making was never the weak part. The status of a job lives in three places, and each can be out of date by afternoon.
Before buying any big software, try this for one week: note every time someone asks "kahan hai?" and who they ask.
That list is your real requirement. Start there, not with a feature wish list.
What do you do first when a customer calls about a late order?
#Manufacturing #MSME #Operations
[109 words. Optional visual: a photo of a real order notebook or whiteboard from the audit, blurred.]

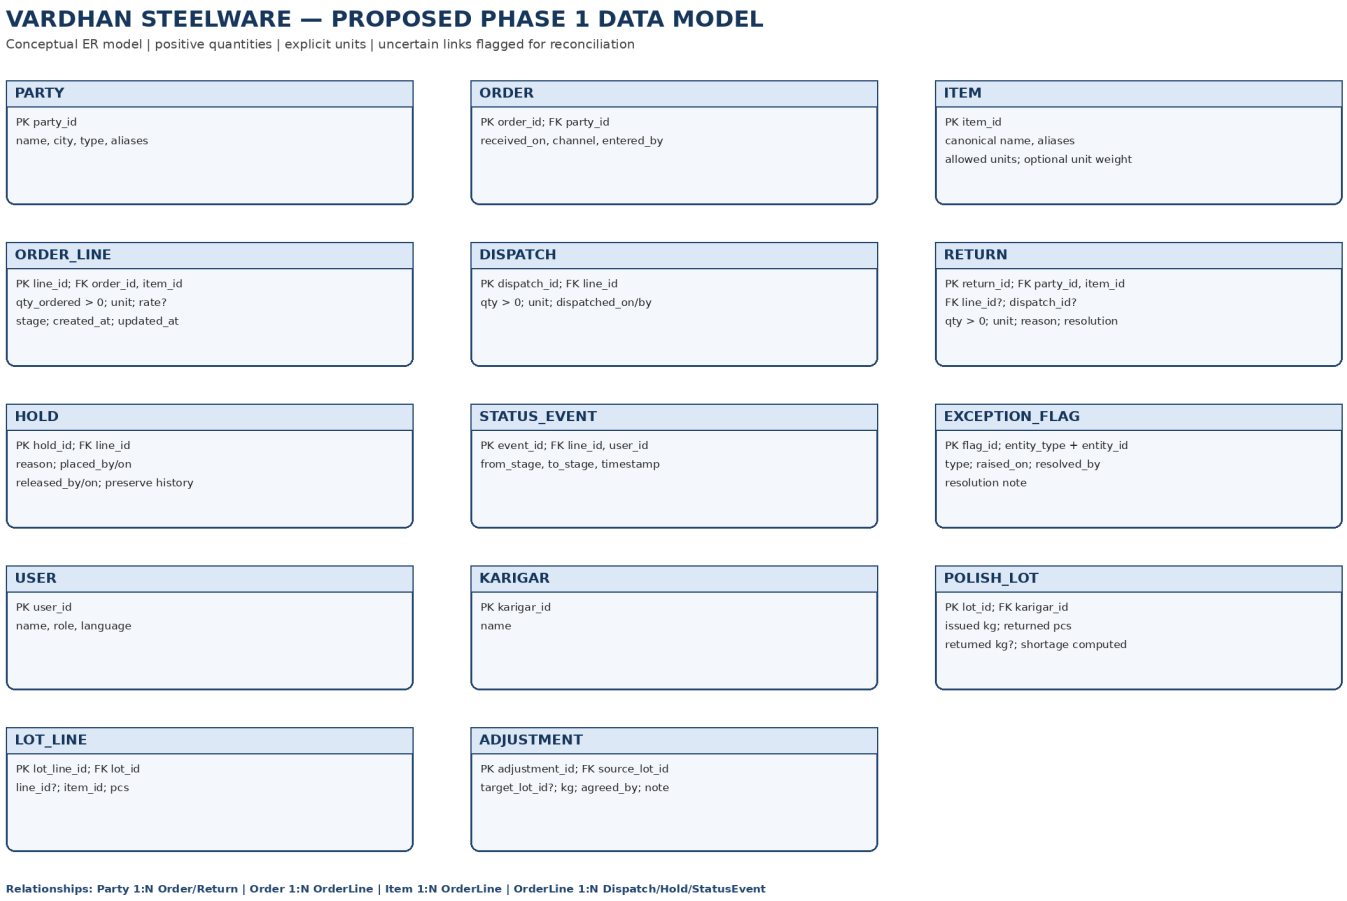

2. Meta ad (Hinglish)

Primary text	Customer ka phone aaya: "Mera maal kab jayega?" Aap supervisor ko phone lagate ho. Woh diary kholta hai. Phir aap customer ko wapas phone karte ho. Kya order ka status seedha aapke phone par dikh sakta hai: kaunsa order kahan hai, aur kyun ruka hai? Koi bhaari software nahi. Bas aapke order ka rasta, simple tareeke se. Apni factory ka order-to-delivery flow humein batayein.
Headline	Kaunsa order kahan hai? Phone par dekhein
Button / call to action	[Confirm with Wantace: e.g. "Baat karein" or WhatsApp message. No offer is promised here.]
Creative concept	Split screen. Left: an owner on a phone call, a notebook and a WhatsApp scroll, with a "?" over them. Right: one clean phone screen with three order cards tagged "Polish mein", "Hold" and "Ready". Overlay text: "Maal kahan atka hai?". Mock data only; no real names or numbers.
Why Hinglish	Owners in North India mostly talk Hindi with English business words ("order", "dispatch", "polish", "status") and type WhatsApp in Roman script, which is also how the client call was written down. Pure English reads like an IT vendor; pure Devanagari reads formal. Hinglish is easy to scan on a small feed. This choice rests on the client call, not on audit evidence: validate it, and consider A/B testing a Devanagari headline.

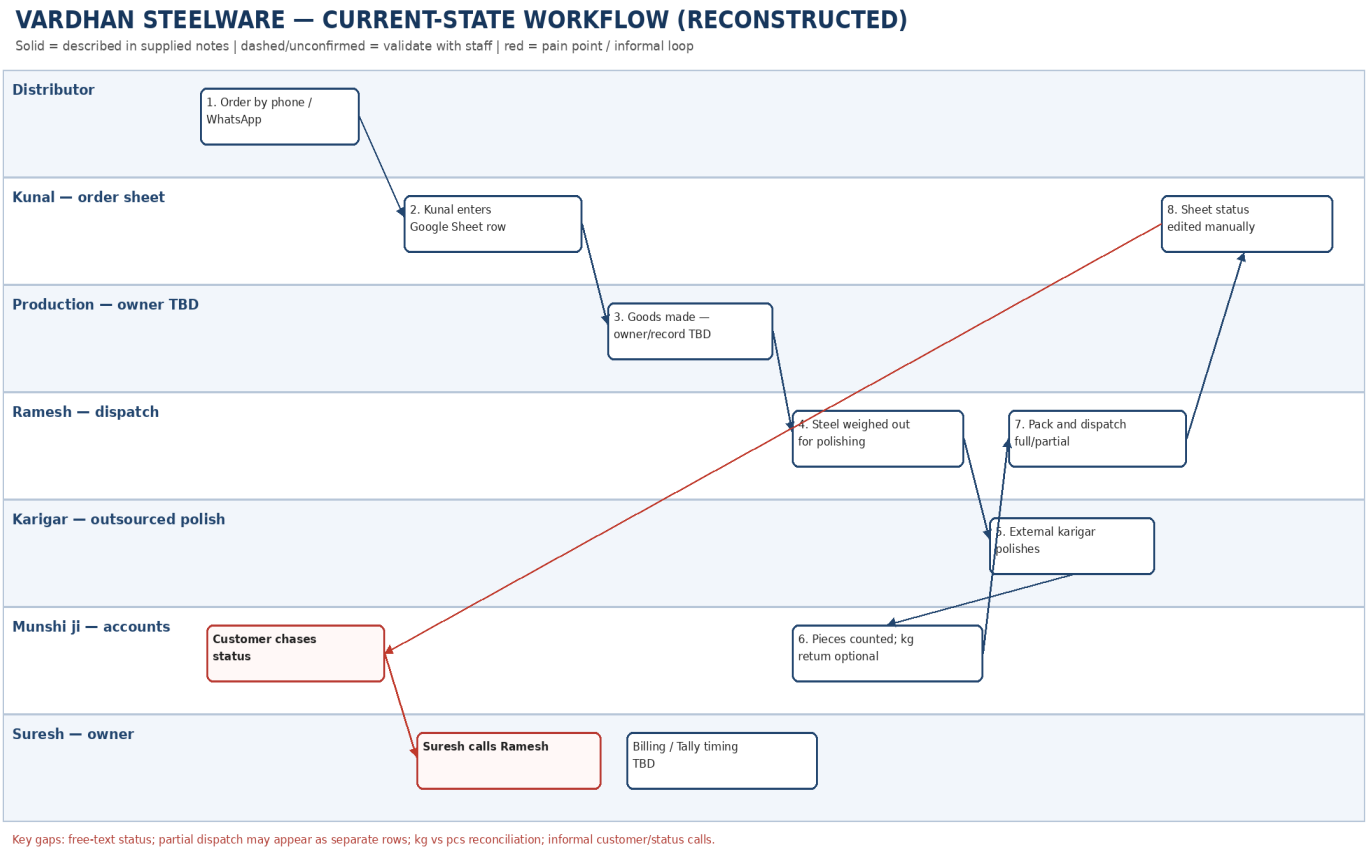

Wantace Solutions Sprint — Supporting Diagrams

The swimlane depicts the reconstructed current state from the supplied client pack. Dashed/unconfirmed elements require discovery. The ER model is a proposed Phase 1 data model, not an implemented system.

Appendix A — Proposed ER data model

Appendix B — Current-state swimlane

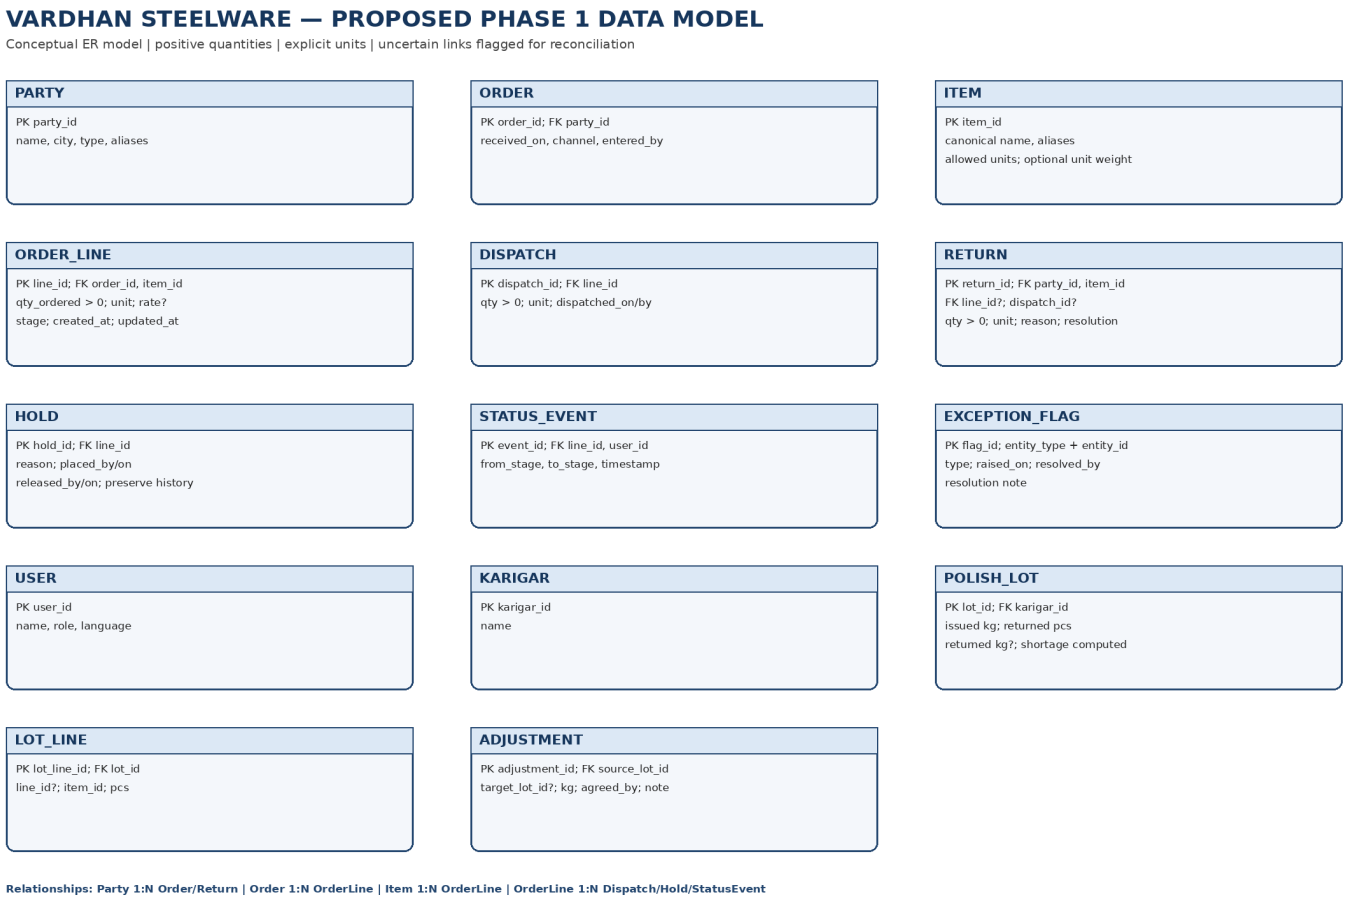

Validation notes: confirm production ownership, billing/Tally timing, and the real relationship between polishing lots and order lines. Keep kg, pcs, dozens and sets separate unless a conversion is explicitly validated. Returns and suspected duplicates require reconciliation rather than silent edits.

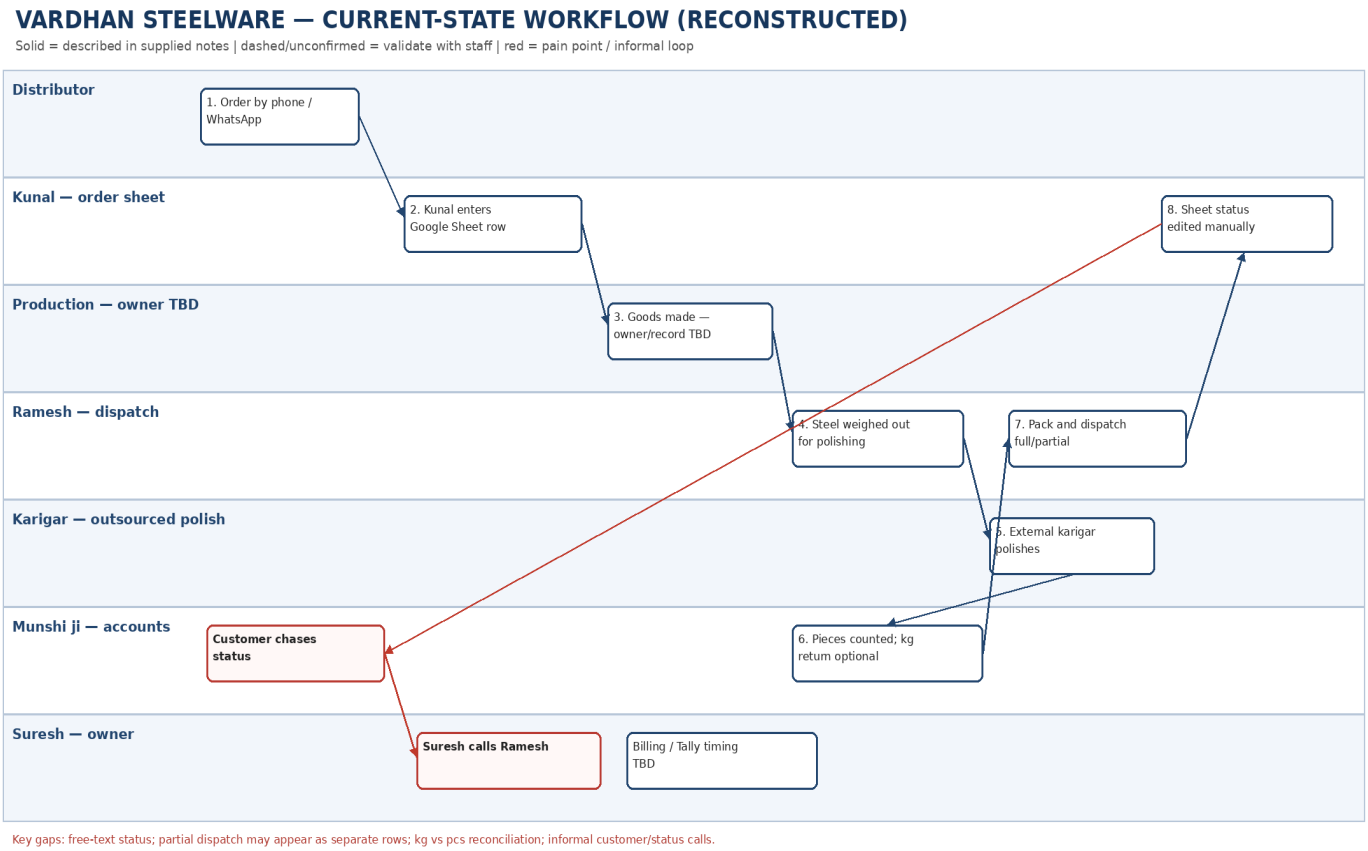

Wantace Solutions Sprint — Supporting Diagrams

The swimlane depicts the reconstructed current state from the supplied client pack. Dashed/unconfirmed elements require discovery. The ER model is a proposed Phase 1 data model, not an implemented system.
